

# The Many Costs of Remoteness

Evidence from 600,000 Villages in India

Sam Asher (World Bank)

Karan Nagpal (University of Oxford)

Paul Novosad (Dartmouth College)

Inclusive and Sustainable Growth in India Conference

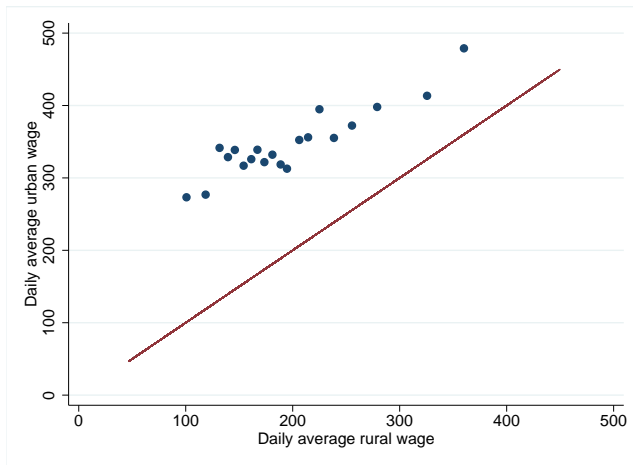

IIEP, George Washington University

October 5, 2016

# Motivation

- Developing countries urbanizing rapidly, but many differences with earlier urbanization in rich countries
  - Urbanization without industrialization (Gollin et al, 2016)
  - Urbanization outstrips growth (Glaeser, 2014)
  - Spatial equilibrium may not hold in India despite large rural-urban wage gaps (Chauvin et al, 2016)
- Much work in economics on causes of urbanization
  - Pull and push factors
- Our agenda: what role do cities play in economic development and poverty alleviation in rural areas?

# Rural wages track wages in nearby cities

# Cities and rural development

- Open economy cities not necessarily reliant on rural hinterland
- Little evidence on urban → rural growth channel
- Channels
  - Goods markets
    - Imports and exports, ag and non-ag
  - Labor markets
    - Only 42% of HH send no migrants (2002)
  - Public service delivery

# This presentation

- Paper 1: labor market impacts of rural road construction
- Paper 2: educational impacts of roads
- Paper 3: costs of administrative remoteness

# Research challenge

- Empirical requirements
  - Large number of cities and rural areas
  - Consistent data over space and time
  - Exogenous variation in linkages to urban areas
- India as ideal laboratory: lots of data, high spatial resolution, consistent across entire country
  - We've assembled various censuses that cover India's 8k towns and 600k villages
  - Begun process of geocoding within cities

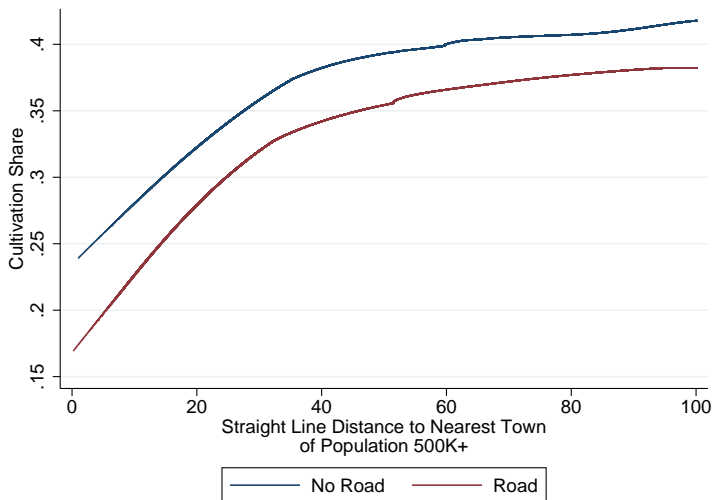

# The data

- Economic Census (1990, 1998, 2005...2012)
  - Census of non-farm establishments, rural and urban, formal and informal (42m firms in 2005)
  - Employment, ownership, product code
- Village- and town-level demographic censuses (1991-2011)
  - Demographic data and amenities
- Socioeconomic censuses
  - Poverty census (2002, rural only)
  - SECC (2012, all urban and rural HH)
  - Household structure, education, parents education, occupation, durables, income and source of income
- Geocoded at town and village level

# Roads and structural transformation

- Hypothesis: poor rural transport infrastructure prevents reallocation of labor
  - Over 1 billion people lack paved road access
  - India has made large gains in rural road construction (from low baseline)
    - Villages with paved roads: 33% (1991) → 49% (2001) → 56% (2011)
    - Varies greatly by state (southern states at 80% in 2001)
- Test: estimate labor market effects of India's national rural road construction program
  - Add to growing lit on role of transport infrastructure in economic development
- Impact theoretically ambiguous
  - Road increases mobility of both goods and labor
  - Effects depend on relative changes to labor productivity across sectors
  - May be other binding constraints to labor market access

# Structural transformation and access to urban markets

# Empirical challenges

- ① Road placement endogenous
  - Political and economic determinants of investment

# Empirical challenges

- ① Road placement endogenous
  - Political and economic determinants of investment
    - Exploit discontinuities in treatment probability due to program rules

# Empirical challenges

- ① Road placement endogenous
  - Political and economic determinants of investment
    - Exploit discontinuities in treatment probability due to program rules
- ② Data availability
  - Most available data lack required spatial resolution

# Empirical challenges

- ① Road placement endogenous
  - Political and economic determinants of investment
    - Exploit discontinuities in treatment probability due to program rules
- ② Data availability
  - Most available data lack required spatial resolution
    - Geocoded microdata of every rural individual and household in India ( $N = 825\text{m}$ , 600k villages)

# Pradhan Mantri Gram Sadak Yojana (PMGSY)

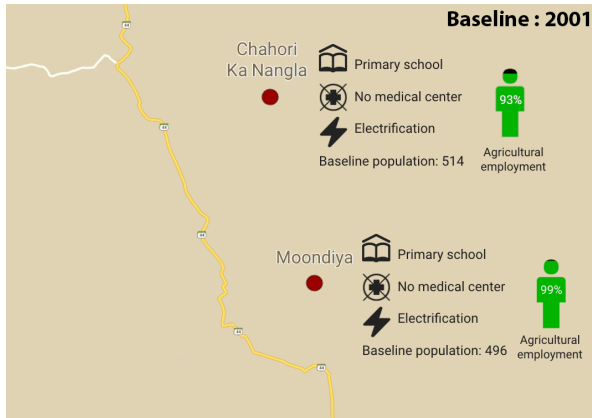

- Launched in 2000 to connect all villages to road network
- By 2015:
  - 113,000 roads constructed (400,000 km)
  - 107,000 previously unconnected villages benefited
  - > \$37 billion disbursed
- Funded centrally, construction administered by states
- Transparent, systematic electronic record keeping: details of every habitation and road built
- Objective eligibility rules
  - Prioritization to villages over 1000, 500 population

# What is a rural road?

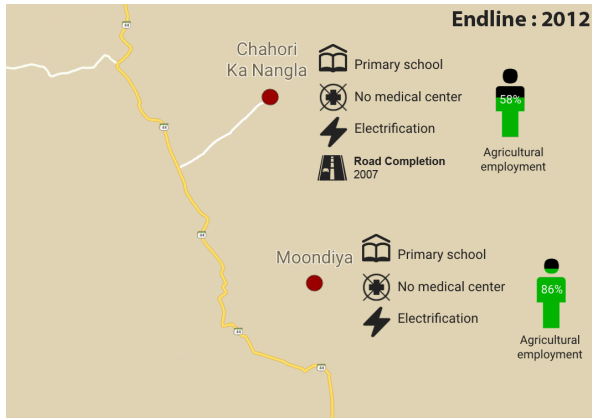

- Paved all weather road
- Median length 4 km
- Connects village to paved road network
- Village is terminus 71% of cases
- Not major artery to other regions

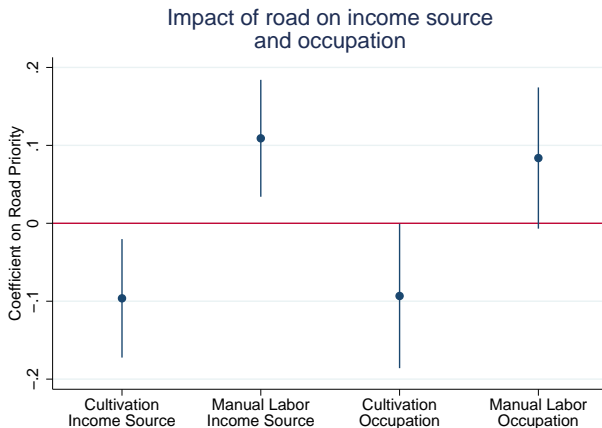

# Example: before

# Example: after

# Agriculture down in both income source and occupational data

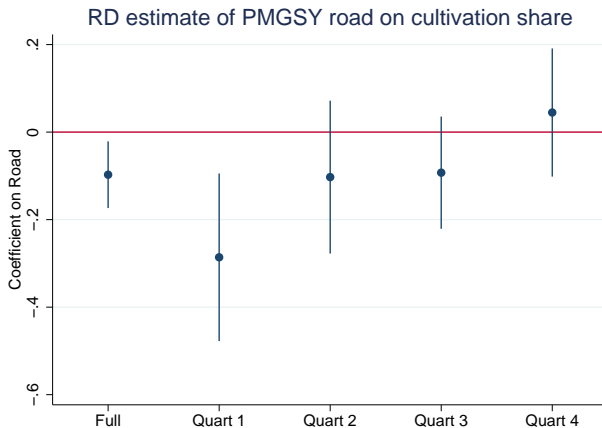

# Migration and economic outcomes

- Recent work suggests lowering transport costs can facilitate out migration
  - However increased economic opportunities may decrease net out migration
  - Our evidence suggests little effect on migration
    - No significant change in population growth, even in villages close to cities
    - Stable age distribution and male population share
- Do the roads bring visible improvements to economic outcomes? We observe:
  - Noisy gains to income and solid house materials
  - No increase in other durable assets
  - Increase in growth rate of night lights
- Within village: impacts largest for low caste, small landholders, men

# Access to urban markets

- Impact of transportation infrastructure likely to depend on market access that it facilitates
  - Redding and Sturm (2008); Donaldson and Hornbeck (2015)
- Examine results by straight-line distance to major cities (500k+ pop)
- Impacts decreasing in distance to nearest city

# Reallocation decreasing in distance from cities

► Table: Effects by quartile

► Table: City proximity

# Mechanism

- Road could induce movement out of agriculture through reduction in costs of moving goods, labor
- Potential channels
  - ① Increase in within-village nonfarm employment ▶ Non farm firms
  - ② Access to external labor markets ▶ Wage gap ▶ Bus service
  - ③ Decrease in agricultural demand for labor ▶ Agricultural investment
- Evidence suggests external labor market participation

# Takeaways

- We estimate the labor market impact of the largest rural road scheme in history
  - Roads facilitate reallocation from agriculture to wage labor
  - Strongest effects when high access to large cities
  - Driven by groups with likely high returns to reallocation
  - Evidence suggests increased participation in external labor markets
- Argues for transport costs as significant constraint on participation in non-agricultural labor markets
- Cities as drivers of rural change
- But roads no panacea

# Roads and education

- Long run impacts of infrastructure will depend on longer run investments
- Evidence on impacts of openness on education mixed
- Panel and RDD estimates find significant increase in student retention at transition from elementary school
  - Test scores increase despite likely adverse selection
- Impacts highest in poorest areas and where rural-urban wage gaps small
  - Suggests liquidity and substitution effects
  - As in labor markets, roads seem to have largest impacts for the most marginalized

# Administrative remoteness

- Economists usually think of market access in terms of goods and labor
- Cities also administrative centers
- Question: what is the cost of administrative remoteness?
  - African states gets weaker with distance from capital (Bates, 1983; Herbst, 2000; Michalopoulos and Papaioannou, 2014)
  - Remote capitals have higher corruption and lower public good provision (Campante and Do, 2014)
  - Decentralization increases information and incentives (Bardhan, 2002)
- Challenge: isolate impact from other market access
  - Take advantage of administrative boundaries that generate jumps in administrative remoteness but not market access

## Variation within vs across districts

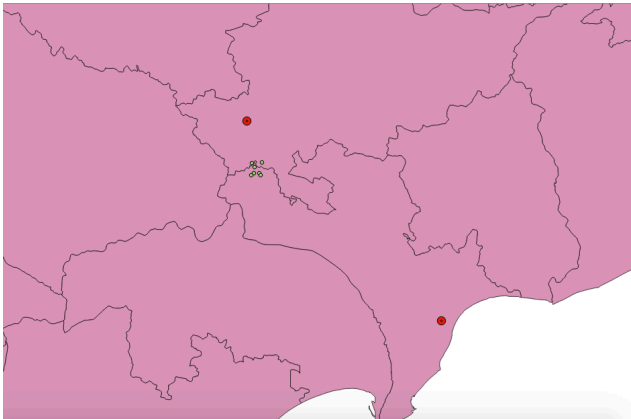

- India is a federal system with national policies implemented by states through district-level administration
- Many programs in India pursue spatial equality through regional targeting, e.g. backwards districts
- We document high levels of inequality within districts
  - Only 23% of variation in mean village earnings is inter-district
- Remoteness helps to explain this pattern

# Remote villages: poorer, fewer amenities, more ag

Table 1: Summary statistics by median distance to nearest town

|  | Full Sample        | Closer Villages    | Remoter Villages   |
|--|--------------------|--------------------|--------------------|
| Distance to District HQ (kms)                    | 38.28<br>(23.92)   | 32.73<br>(22.01)   | 44.03<br>(24.43)   |
| Distance to nearest town (kms)                   | 15.83<br>(10.67)   | 8.383<br>(3.237)   | 23.47<br>(10.24)   |
| Population (2011)                                | 1484.6<br>(2018.7) | 1680.2<br>(2182.0) | 1301.3<br>(1831.1) |
| Mean monthly earnings (2012 Rupees)              | 5113.7<br>(2451.6) | 5171.0<br>(2110.6) | 4787.0<br>(2035.1) |
| Percent households with solid roof (2012)        | 47.75<br>(34.85)   | 52.47<br>(32.67)   | 42.46<br>(36.09)   |
| Percent population literate (2011)               | 57.27<br>(13.94)   | 59.02<br>(12.81)   | 55.29<br>(14.70)   |
| Percent population engaged in agriculture (2011) | 72.14<br>(26.78)   | 69.17<br>(26.56)   | 75.37<br>(26.44)   |
| Percent villages electrified (2011)              | 61.87<br>(48.57)   | 67.31<br>(46.91)   | 56.10<br>(49.63)   |
| Percent villages with govt primary school (2011) | 83.89<br>(36.76)   | 83.87<br>(36.78)   | 84.41<br>(36.28)   |
| Percent villages with health center (2011)       | 22.90<br>(42.02)   | 22.09<br>(41.49)   | 23.93<br>(42.66)   |
| Percent land irrigated (2011)                    | 57.71<br>(38.34)   | 67.73<br>(35.43)   | 47.55<br>(38.46)   |
| Paved Road Access (2011)                         | 80.50<br>(39.62)   | 83.84<br>(36.80)   | 77.13<br>(42.00)   |
| Distance to nearest highway (kms)                | 8.944<br>(8.186)   | 6.953<br>(6.973)   | 11.00<br>(8.803)   |
| Observations                                     | 395184             | 197693             | 193336             |

## Example: Khammam and Krishna districts

# Remoteness lowers provision of roads, schools

**Table 2:** Impact of remoteness on public service delivery

|                                   | Paved Roads          | Electrification     | Primary School      | Secondary School    | Medical Center       |
|-----------------------------------|----------------------|---------------------|---------------------|---------------------|----------------------|
| Distance to District HQ (kms)     | -0.046<br>(0.015)*** | -0.015<br>(0.014)   | 0.020<br>(0.016)    | -0.038<br>(0.015)** | -0.010<br>(0.016)    |

\* $p < 0.10$ , \*\* $p < 0.05$ , \*\*\* $p < 0.01$

# Is the role of remoteness changing over time?

- Effective cost of distance should be falling over time

# Rural road provision

- We measure cost of road provision
  - PMGSY: national program, identical standards
- Roads more expensive to construct when further from HQ
  - Could be either risk premium or higher costs from lower state capacity (e.g. rule of law)
- Future: time to complete, road quality

# Concluding thoughts

- Transport infrastructure moves more than goods: labor, government services
- Rural-rural gap large, persistent
- Impacts of infrastructure and urbanization likely underestimated due to long lags on returns
- What we still don't understand
  - Short-term migration – with implications for policies, data collection, etc
  - Complementarity of infrastructural investments
  - Determinants of urban success
  - Intra-urban policy impacts: zoning, transport, FAR

Thank you!

## Appendix

# Conceptual Framework

- Many channels by which road could affect economic activity
- Transport costs decrease both for goods and people
- Imports and exports likely to increase
- Simple model of occupation choice between cultivation and wage labor
- Ambiguous effect of road construction due to potentially countervailing forces:
  - Changes in agricultural productivity (prices, inputs, etc)
  - Changes in net wages (within-village productivity, search, commuting costs)

# First stage stable across bandwidths

Table 4: First stage effect of road priority on PMGSY road treatment

|               | $\pm 50$            | $\pm 60$            | $\pm 70$            | $\pm 80$            | $\pm 90$            | $\pm 100$           |

# Setup

- Continuum of villages characterized by market access  $a \in [0, \bar{a}]$
- Continuum of agents within each village characterized by  $\theta \sim \mathcal{U}[0, 1]$ 
  - $\theta$  captures relative productivity in cultivation (e.g. age, land)
- Two occupations
  - Cultivation:  $\theta g(a)$
  - Wage labor:  $w(a)$
- Occupation choice
  - Agent of type  $\theta$  chooses cultivation if  $\theta g(a) \geq w(a)$
  - Marginal farmer:  $\tilde{\theta} = \frac{w(a)}{g(a)}$

$$\rightarrow q = q(a) = 1 - \frac{w(a)}{g(a)}$$

# Results 1

How does the share of workers in cultivation change with market access?

$$\frac{\partial q}{\partial a} \leq 0 \leftrightarrow \varepsilon_w \geq \varepsilon_g$$

► Back

## Results 2: monotonicity of $q$

$$q'' < 0 \leftrightarrow \frac{w''}{w} - \frac{g''}{g} > 2\frac{g'}{g}\left(\frac{w'}{w} - \frac{g'}{g}\right)$$

► Back

## Results 2: monotonicity of $q$

$$q'' < 0 \leftrightarrow \frac{w''}{w} - \frac{g''}{g} > 2\frac{g'}{g}\left(\frac{w'}{w} - \frac{g'}{g}\right)$$

# Participation in urban labor markets

- Market access could be for export of goods or labor
- Ideally would observe place of work in/out of village
- If arbitraging urban-rural wage gap, should see largest effects where that gap is largest
- Compute district-level urban and rural wages
- Largest reallocation where gap high ( $\geq \$0.65$ )

► Treatment effect by wage gap

► Back

# Treatment effect by wage gap

## Transport services: buses

- Evidence from Malawi that returns to rural infrastructure investments may be limited by demand (Raballand et al, 2011)
  - Low density and economic activity make transport services unprofitable
- We find increase in bus services to villages, but only in areas closest to cities
- Potentially both supply- and demand-driven

► Bus service
